7226G Exhaust / Intake Manifold Surfacing Fixture Assembly:

Exhaust / Intake Manifold Fixture:

Exhaust instructions:

Note: This fixturing is designed to hold most exhaust manifolds and most intake manifolds from 90 degree V/8 Engines.

Most exhaust manifolds will be surfaced with the supports positioned approximately as shown on next page. Occasionally, however it may be necessary to rearrange the support blocks to fit unusual manifolds.

Place a manifold on the two front brackets. Adjust the rear pin to provide the best support. The best place for the front brackets is under the machined area, for the manifold mounting bolts, at the outside corners of the manifold. The rear pin should be approximately midway between the front brackets on the rear of the part. The pin should support under the main body of the manifold.

Adjust the rear pin up and down to bring the manifold close to level.

Tighten the tow clamps evenly against the cast surface of the manifold (be sure the toe clamps are not pushing on a machined surface). Tighten firmly, test for clamp tightness with a soft faced mallet.

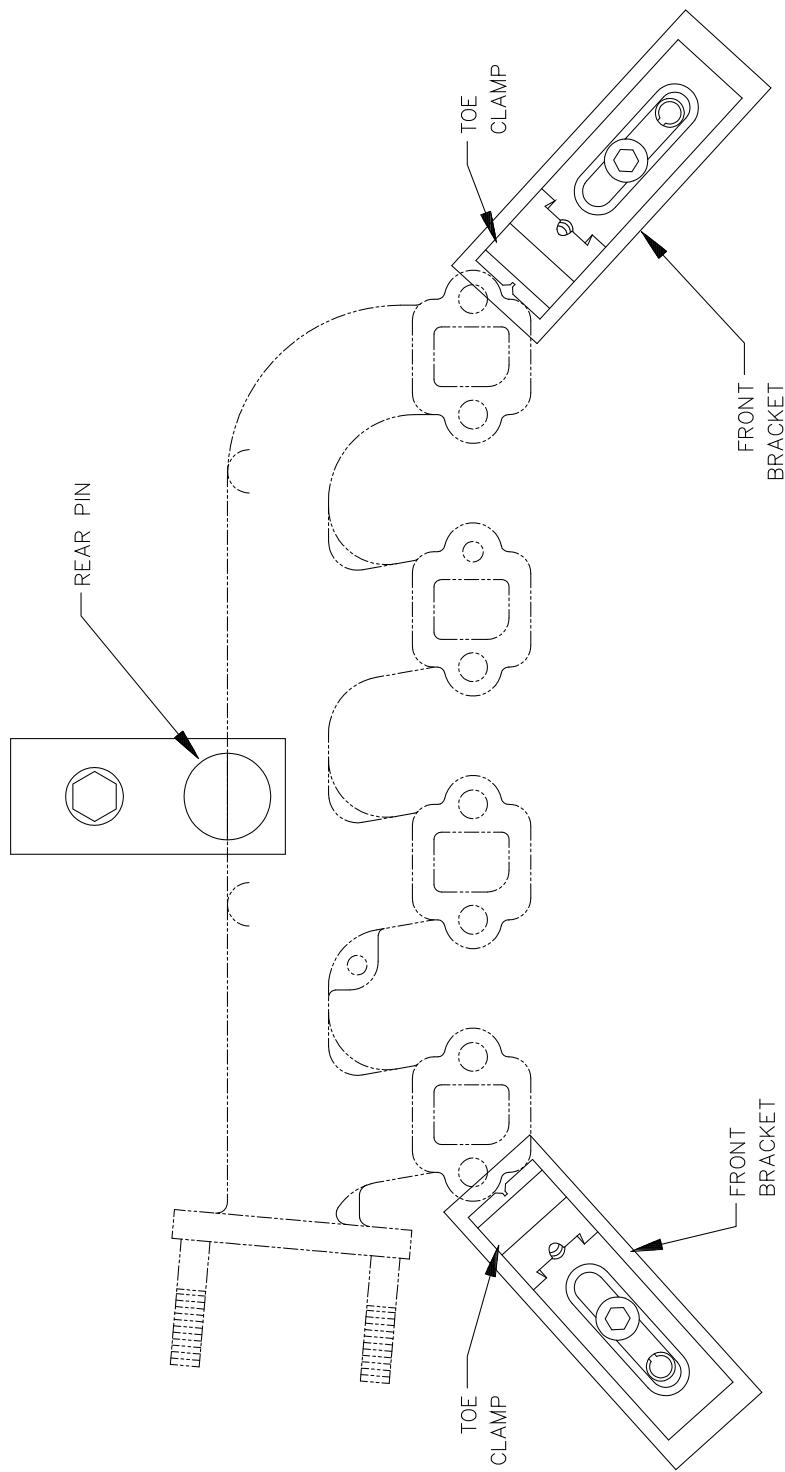

Level the manifold surface using the hand -wheels and the dual axis level system of the table.

Make sure there are no obstructions in the way of the cutterhead you are using. Also be aware of the 14" fly cutter guard, it might interfere with some obstructions. Some manifolds require the use of our 4" diameter shell mill and adapter.

The manifold is ready to surface.

Typical Exhaust Manifold Set-Up:

REFFX4-020993

Intake Instructions:**▲ CAUTION**

At all stages of this process be sure there are no obstructions that might interfere with the cutterhead or it's guard.

This fixture will require parts from the Rottler universal head tooling package.

This fixture is designed primarily for intake manifolds from 90 degree V-8 engines.

Start with the support blocks arranged as shown on the next page. Leave, the hold down bolts, finger tight, so that the blocks will slide easily.

Place the manifold in the two rear support brackets as shown. Adjust the brackets so they fit flush and parallel on one intake surface. Tighten the hold down bolts securely.

Adjust the remaining two support blocks to give to the manifold at the front. Slide the clamp assembly over and position the clamp foot so it will push on a solid area of the manifold, approximately centered

Tighten the clamp handle securely. Check to make sure the manifold did not move.

Using a small precision level, level the exposed intake surface, in both directions, by tilting the dual axis table as necessary.

Using the left hand-wheel only, rotate the table to level the lower surface of the manifold. This is done to make sure the dual axis table has enough travel. Rotate the table back up to the intake surface. Level this surface again.

This surface is ready to cut.

After surfacing rotate the table, using the left hand-wheel only, down to the center or lower surface, level this surface.

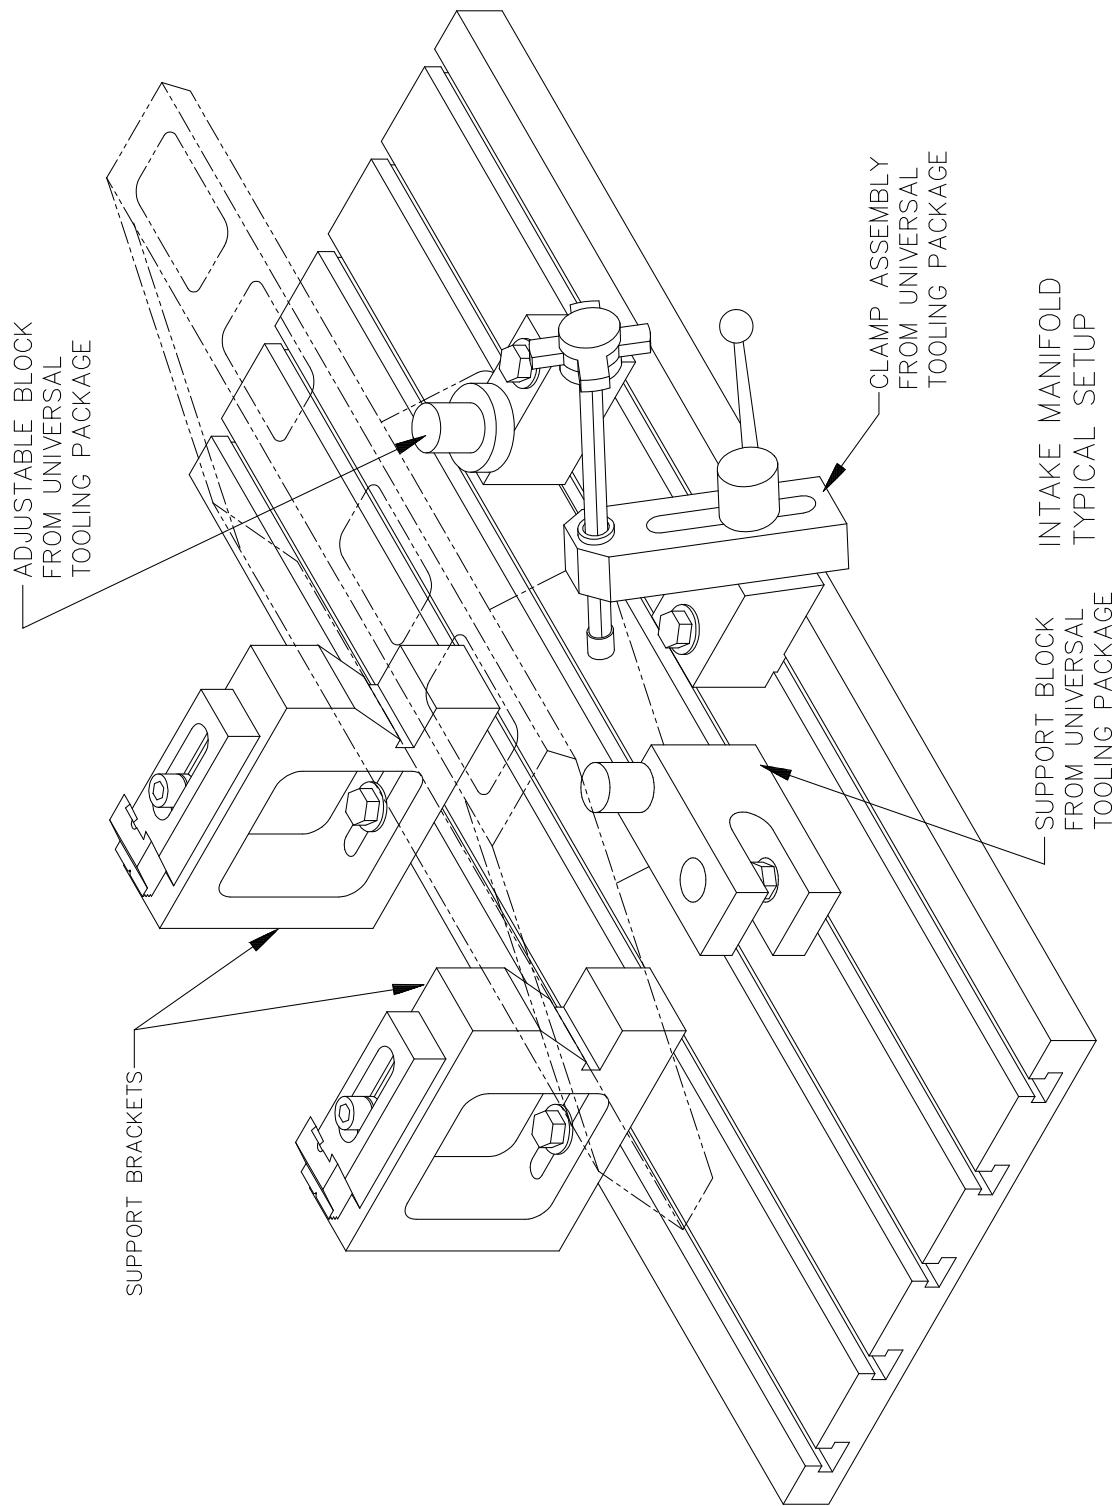

This surface is ready to cut.

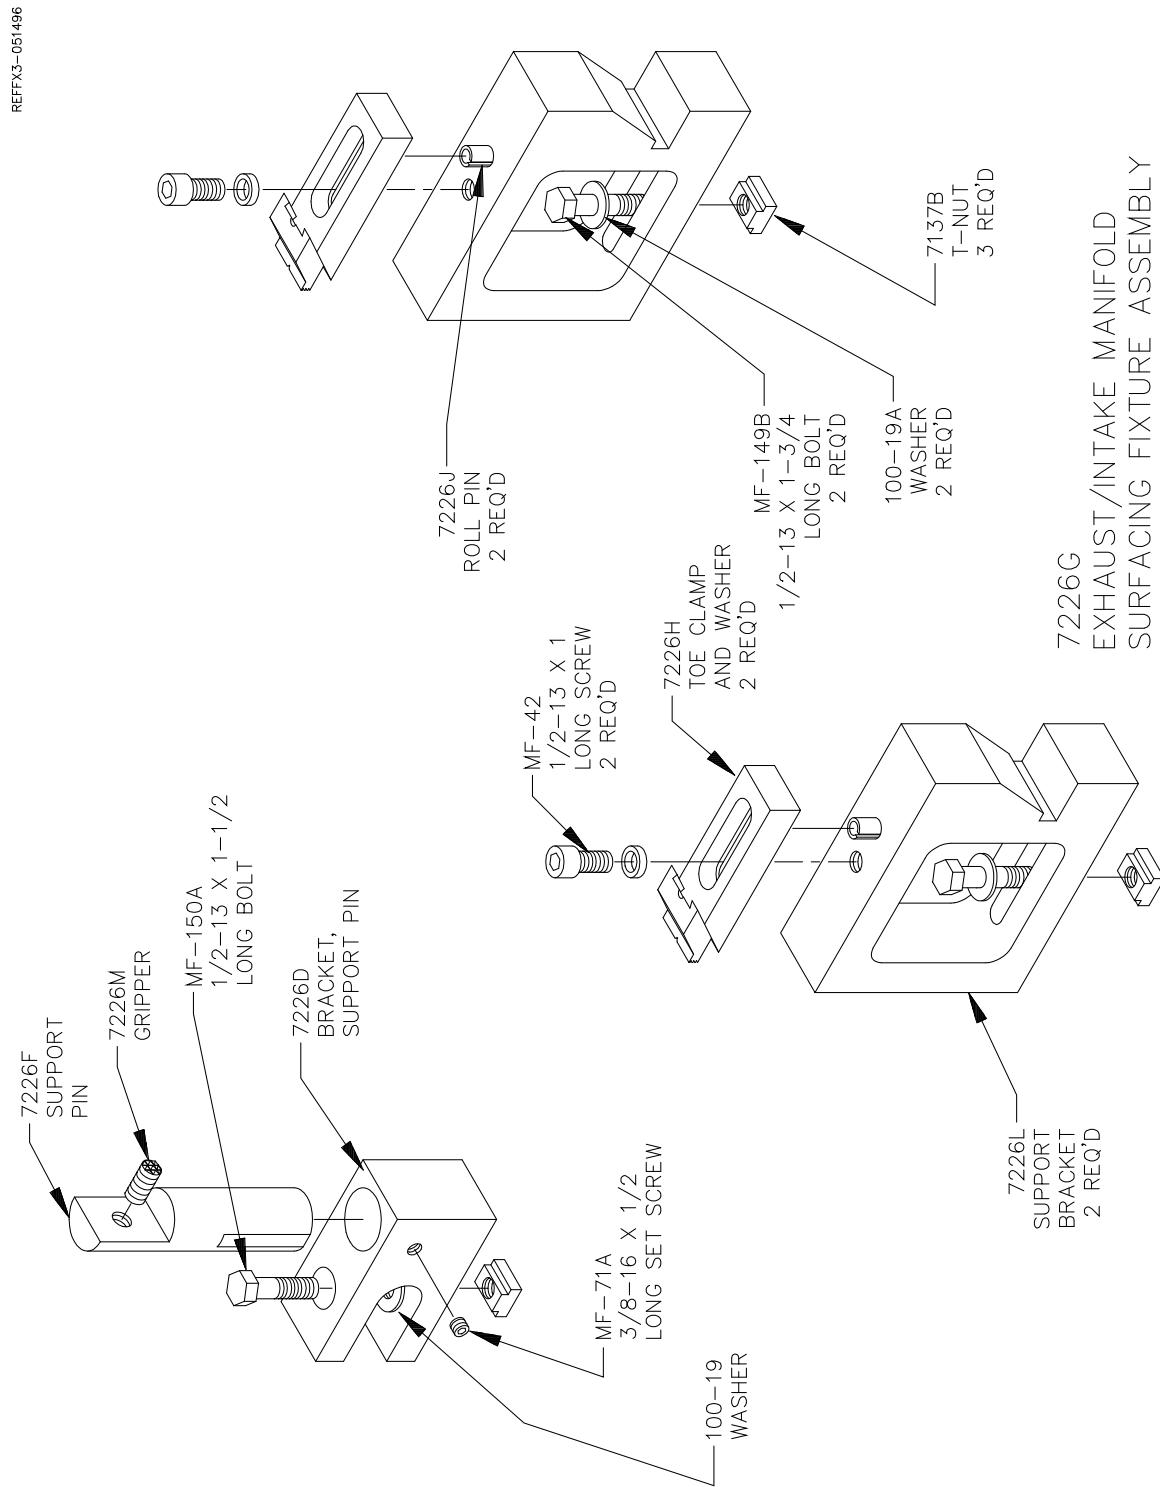

Loosen the clamp screw and remove the manifold. Turn it around and reload with the fresh cur surface in the rear support blocks. Level the intake manifold surface and cut it.

Using the left hand-wheel level the second lower surface and cut it.

Typical Intake Manifold Set-Up:

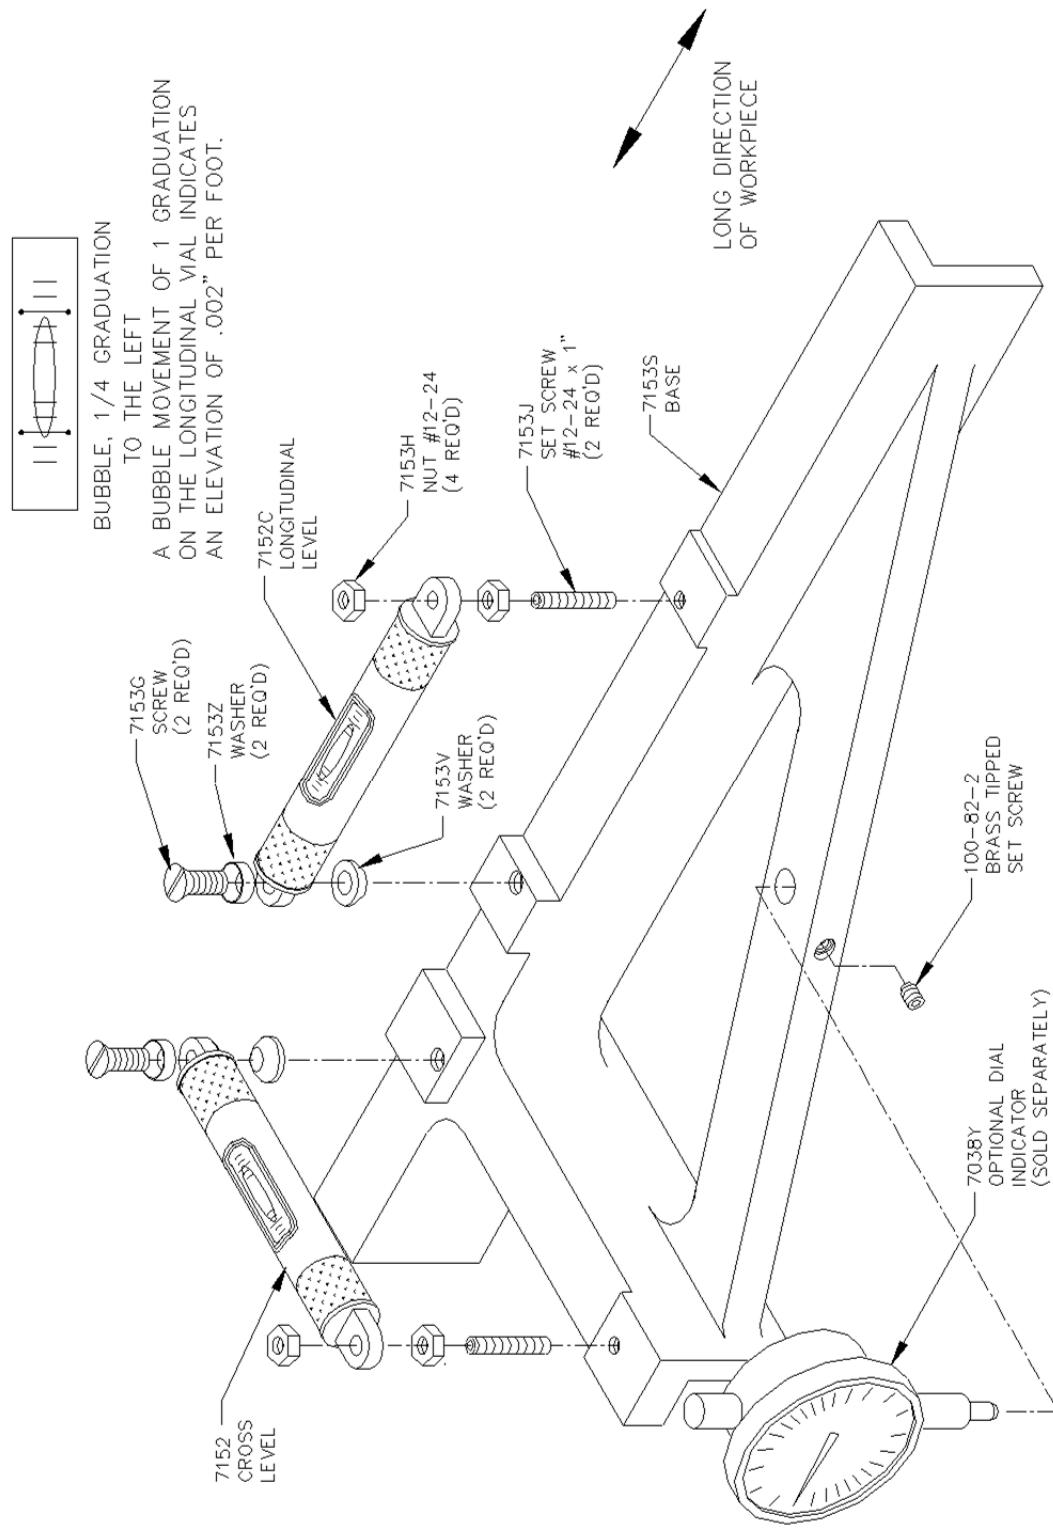

REFFX5-070893

7226G Exhaust / Intake Manifold Assembly:

7152A Dual Axis Level Assembly:

ILLUSTRATION A

NOTE: 7152A ASSEMBLY DOES NOT INCLUDE 7038Y DIAL INDICATOR

Cutterheads:

Changing Cutterheads:

⚠ CAUTION

Press the Emergency Stop button when ever you are changing cutterheads.

Remove the centering fingers before changing the cutterhead. Not doing so could result in the finger not extending or retracting all the way on an automatic cycle.

Turn the cutterhead release knob, the draw bar will drop down about $\frac{1}{2}$ ". Turn the cutterhead 90 degrees, lower the cutterhead out of the inner spindle slowly so not to damage the taper on either part.

Thoroughly clean the end, including inside the hole, of the cutterhead that is going to be put in. Be sure the cutterhead release switch is on. Line up the slot in the cutterhead, with the draw bar nose. Lift the cutterhead up as high as it will go.

Turn the centering knob handle to engage the centering rod spline inside the cutterhead. Line up the key, on the cutterhead, with the keyway in the inner spindle. Turn the cutterhead release knob to secure the cutterhead. Be sure the key lines up properly so the cutterhead pulls up into the inner spindle.

A dampener weight is in most Rottler boring cutterheads, to improve the performance of the boring machine. The dampener weight requires little or no maintenance. Occasionally, the dampener weight will get contaminated with dirt or liquids. If this happens, the operator will experience chatter problems. The cutterhead will have to be removed, disassembled, and cleaned. Disassembly is done by removing the screws located in the bottom of the cutterhead. (see illustrations following).

Cutting Inserts:

Below is a description of the cutting inserts available from Rottler. The inserts have gone through extensive performance testing. To take full advantage of the capabilities of your Rottler machine, we highly recommend Rottler cutting tools be used. Rottler machine performance can be significantly reduced if qualified tooling is not used. Using an incorrect insert can result in bore geometry inconsistency, short tool life, and poor surface finish.

Below are general guidelines. When using these inserts it is best to refer to the operator manual of the particular machine you are using. Rottler Manufacturing's latest operator manuals have more detailed information on feeds and speeds for the particular machine and cutterhead that you are using.

General Information

Rottler CBN and PCD Inserts are laser marked with our part number on one side. On single sided inserts, the part number is on the back side of the insert.

Rottler surfacing insert toolholders are designed so they can hold square and round inserts that are of the same basic size. For example, a 3/8" IC round and 3/8" IC square insert will fit into the standard 3/8" IC Rottler toolholders. IC stands for inscribed circle.

Rottler SF, F60, F80 and F90 Series surfacing cutterheads are supplied standard with Rottler 3/8" IC toolholders fitted to our surfacing heads. Optional 1/2" toolholders are interchangeable with 3/8" toolholders.

Insert breaking or chipping can be caused by several things. It can be caused by not operating the insert at the correct RPM. It is very typical for an insert to break or chip when cutting too slow. Interrupted cuts can cause an insert to break as well. When making a heavy sleeve cut in a cylinder that has been cracked it is often required to slow the RPM down to 1/2 the normal operating speed to prevent chipping of the insert.

Cutting Speed Calculation

Inserts are designed to cut within a speed range (S.F.P.M.). In order to convert from cutting speed to RPM, use the following formula:

$$\text{RPM} = \frac{\text{S.F.P.M.} \times 3.82}{\text{DIAMETER}}$$

S.F.P.M. = Surface Feet per Minute

RPM = Revolutions per Minute

DIAMETER in Inches

The feed rate on most Rottler machines is designated in inches (mm) / revolution. The F65M and the SFM have feed rates designated in inches (mm) / minute. It is important to adjust the inches (mm) / minute rate to obtain the correct load (inches / revolution). Following are the formulas to use. You do not have to perform this calculation with an "A" model machine

If you know the RPM and the Feed Rate per Revolution you want, use the following formula to obtain the correct Feed Rate per minute.

$$\text{FRM} = \text{RPM} \times \text{FRR}$$

FRM = Feed Rate Inches per Minute

FRR = Feed Rate Inches per Revolution

RPM = Spindle Revolutions per Minute

Cylinder Boring Inserts

Rottler has just completed the development of group of new triangular inserts for cylinder boring. Extensive trials were made to come up with new inserts that would outperform the older inserts. The result is a group of inserts that are the same unit cost but have 5 – 50% increased tool life. The increased tool life decreases overall operation cost to the end user.

RT321 (General purpose and sleeving)

A 3/8" IC triangular insert with a black ceramic coating and 1/64" cutting radius. This insert is the best to use for counterboring when the small corner radius is required for clearance or when the machine is at its extended travel limits. The 1/64" radius should be used when machining to a step where the mating part requires a smaller radius to eliminate an interference problem in the radius. If you are machining a long bore where the spindle must be extended towards the limits of its travel or if a long stub bar is being used, the 1/64" radius will minimize the possibility of chatter. A feed rate of .002 - .005 per revolution should be used to obtain a typical surface finish. When machining large counter bores typically found in Cummins or Cat Blocks, a feed rate of .002 - .004/rev. should be used. When cutting gray cast iron use a speed in the 800 – 1200 S.F.P.M. area for best productivity and tool life.

When cutting nodular, ductile, or compacted graphite cast iron the speed should be in the 200 – 400 S.F.P.M. area – 300 RPM on a 4" diameter bore. Nodular, ductile, or compacted graphite cast irons, is found most often in high performance engine blocks or sleeves. When cutting these tuff cast irons it is best to use a feed rate of between .006 and .010 per revolution.

RT322 (General purpose and sleeving)

This is the same insert as RT321, except it has a 1/32" radius. This insert is the best to use for heavy sleeve cutting and can also be used for general machining and counterboring. This larger radius insert will give a smoother finish for a given feed rate when sleeve cutting to allow easier sleeve fitting and closer metal to metal contact for heat transfer. It is possible to use a feed rate that is 30% faster with the RT322 compared with the RT321 and still obtain the same finish. The 1/32" radius is stronger than the 1/64 radius of the RT321. The RT322 should always be used for heavy sleeve cuts unless the finish part requires the smaller radius for clearance or you are cutting a long bore. The larger radius creates more tool pressure than the small radius. The increased tool pressure may cause chatter in the finish if machining very long bores. A feed rate of .006 - .012 per revolution should be used to obtain a typical surface finish. When machining large counter bores typically found in Cummins or Cat Blocks, a feed rate of .002 - .004/rev. should be used. When cutting gray cast iron use a speed in the 800 – 1200 S.F.P.M. area for best productivity and tool life.

When cutting nodular, ductile, or compacted graphite cast iron the speed should be in the 200 – 400 S.F.P.M. area – 300 RPM on a 4" diameter bore. Nodular, ductile, or compacted graphite cast irons, is found most often in high performance engine blocks or sleeves. When cutting these tuff cast irons it is best to use a feed rate of between .006 and .010 per revolution.

RT211 (General purpose and sleeving)

A 1/4" IC triangular insert with a black ceramic coating and 1/64" cutting radius. The 1/64" radius should be used when machining to a step where the mating part requires a smaller radius to eliminate an interference problem. If you are machining a long bore where the spindle must be extended towards the limits of its travel or if a long stub bar is being used, the 1/64" radius will minimize the possibility of chatter. A feed rate of .002 - .005 should be used to obtain a typical surface finish. When machining large counter bores typically found in Cummins or Cat Blocks, a feed rate of .002 - .004/rev. should be used. When cutting gray cast iron use a speed in the 800 – 1200 S.F.P.M. area for best productivity and tool life.

When cutting nodular, ductile, or compacted graphite cast iron the speed should be in the 200 – 400 S.F.P.M. area – 300 RPM on a 4" diameter bore. Nodular, ductile, or compacted graphite cast irons, is found most often in high performance engine blocks or sleeves. When cutting these tuff cast irons it is best to use a feed rate of between .006 and .010 per revolution.

RT212 (General purpose and sleeving)

This is the same insert as RT212, except it has a 1/32" radius. This larger radius insert will give a smoother finish when sleeve cutting to allow easier sleeve fitting and closer metal to metal contact for heat transfer. The 1/32" radius is stronger than the 1/64 radius of the RT321. The RT322 should always be used for sleeve cuts unless the finish part requires the smaller radius for clearance or you are cutting a long bore. The larger radius creates more tool pressure than the small tool radius. The increased tool pressure will create chatter in the finish. A feed rate of .006 - .012 should be used to obtain a typical surface finish. When machining large counter bores typically found in Cummins or Cat Blocks, a feed rate of .002 - .004/rev. should be used. When cutting gray cast iron use a speed in the 800 – 1200 S.F.P.M. area for best productivity and tool life.

When cutting nodular, ductile, or compacted graphite cast iron the speed should be in the 200 – 400 S.F.P.M. area – 300 RPM on a 4" diameter bore. Nodular, ductile, or compacted graphite cast iron, is found most often in high performance engine blocks or sleeves. When cutting these tuff cast irons it is best to use a feed rate of between .006 and .010 per revolution.

RT321F (Precision Counterboring and Finishing)

A 3/8" IC triangular insert with a gold coating and 1/64" cutting radius. The coating gives the best finish results when machining precision counter bores often machined in diesel engine blocks. The 1/64" radius should be used when machining to a step where the mating part requires a smaller radius to eliminate an interference problem. If you are machining a long bore where the spindle must be extended towards the limits of its travel or if a long stub bar is being used, the 1/64" radius will minimize the possibility of chatter. A feed rate of .002 - .005 should be used to obtain a typical surface finish. When machining large counter bores typically found in Cummins or Cat Blocks, a feed rate of .002 - .004/rev. should be used.

When cutting nodular, ductile, or compacted graphite cast iron the speed should be in the 200 – 400 S.F.P.M. area – 300 RPM on a 4" diameter bore. Nodular, ductile, or compacted graphite cast iron, is found most often in high performance engine blocks or sleeves. When cutting these tuff cast irons it is best to use a feed rate of between .006 and .010 per revolution.

RT322F (Precision Counterboring and Finishing)

A 3/8" IC triangular insert with a gold coating and 1/32" cutting radius. The coating gives the best finish results when machining precision counter bores often machined in diesel engine blocks. A feed rate of .004 - .008 should be used to obtain a typical surface finish. When machining large counter bores typically found in Cummins or Cat Blocks, a feed rate of .002 - .004/rev. should be used. When cutting gray cast iron use a speed in the 300 - 800 S.F.P.M. area for best productivity and tool life. Tool life of this insert is significantly less than the RT322.

RT211F (Precision Counterboring and Finishing)

A 1/4" IC triangular insert with a gold coating and 1/64" cutting radius. The coating gives the best finish results when machining precision counter bores often machined in diesel engine blocks. The 1/64" radius should be used when machining to a step where the mating part requires a smaller radius to eliminate an interference problem. If you are machining a long bore where the spindle must be extended towards the limits of its travel or if a long stub bar is being used, the 1/64" radius will minimize the possibility of chatter. A feed rate of .002 - .005 should be used to obtain a typical surface finish. When machining large counter bores typically found in Cummins or Cat Blocks, a feed rate of .002 - .004/rev. should be used. When cutting gray cast iron use a speed in the 300 - 800 S.F.P.M. area for best productivity and tool life. Tool life of this insert is significantly less than the RT211.

RT212F (Precision Counterboring and Finishing)

A 1/4" IC triangular insert with a gold coating and 1/32" cutting radius. The coating gives the best finish results when machining precision counter bores often machined in diesel engine blocks. A feed rate of .002 - .005 should be used to obtain a typical surface finish. When machining large counter bores typically found in Cummins or Cat Blocks, a feed rate of .002 - .004/rev. should be used. When cutting

gray cast iron use a speed in the 300 - 800 S.F.P.M. area for best productivity and tool life. Tool life of this insert is significantly less than the RT211.

RS322 (for high speed oversize through boring)

A 3/8" IC, square insert with a black ceramic coating. It is used on Rottler boring machines for through boring when removing .010" (.25mm) - .060" (1.5mm) inches on the diameter. A very economical insert as it has 8 cutting edges. On a 4" (100mm) bore use 1000 - 1200 RPM and a feed rate of .008" (.2mm) - .012" (.3mm) per rev feed rate to obtain the typical surface finish. The insert can also be used for sleeve cuts when a square step is not required. For example, when used on an F80 or F5 machine it can be run at 1000 – 1200 RPM and .005/rev (.12mm) feed rate to remove up to .200" (5mm) on the diameter from a 4.200" (106mm) inch bore.

When cutting nodular, ductile, or compacted graphite cast iron the speed should be in the 200 – 400 S.F.P.M. area – 300 RPM on a 4" diameter bore. Nodular, ductile, or compacted graphite cast iron, is found most often in high performance engine blocks or sleeves. When cutting these tuff cast irons it is best to use a feed rate of between .006 and .010 per revolution.

501-29-6B R4 (for oversize through boring)

A 3/8" IC square insert with a gold titanium coating. It is used for through boring when removing .010" (.25mm)-.060" (1.5mm) inches on the diameter. A very economical insert as it has 8 cutting edges. For best tool life use 500 - 800 S.F.P.M. Use a feed rate of .004 - .010 to obtain the typical surface finish. This insert is most commonly used on older boring machines which are not capable of turning faster than 700 RPM.

6301E (for high speed oversize through boring)

This is a square 3/8" IC, 1/32" Radius, double sided, CBN Insert. These inserts are intended for use on high speed boring on Rottler F80 and F90M series machines. On common cast iron blocks the RPM should be set to achieve 1000 – 2200 S.F.P.M. On harder cast irons the RPM should be reduced to obtain acceptable tool life. A feed rate of .010" - .014" per revolution. They have exceptional long life when removing up to .040" on the diameter. They do not give good tool life on some cast irons with high sulfur content.

501-29-6K (for high speed aluminum boring)

This is a 3/8" IC, triangle insert with a black diamond tip. It has a 1/32" radius. This insert is used to bore aluminum cylinders. It can not be used to bore any other material. It is the best insert for finishing aluminum. For best tool life and finish the insert can be run from 400 – 4000 SFM. Feed rates between .004 and .010 should be used.

Surfacing Inserts

Below are the inserts commonly used on Rottler machines in surfacing/milling applications. Please read carefully.

6303B

A round 3/8" IC, double sided, CBN Insert. An excellent, long life insert for surfacing cast iron heads and blocks -round shape gives many cutting edges on each side of insert. When using a 14" cutterhead (SF, F65, F80) speeds range from 900-1200 RPM. When using an 18" cutterhead speeds range from 600-800 RPM.

6303M

A round 3/8" IC, single sided, PCD Insert. For use on aluminum only - heads and blocks without liners. This insert has a thin layer of PCD applied to a carbide disk. The diamond appears to be a shiny black wafer. The hardness of the diamond resists the abrasive nature of the silica in aluminum heads and blocks. RPM speeds with a 14" cutter range from 900-2000 RPM.

6303U

A round 3/8" IC, single sided, CBN Insert. This insert does an excellent job when cutting hard cast iron blocks and heads of a single material or bi-metal. This insert is the best to use when machining compacted graphite cast iron heads and blocks often found in the performance industry. RPM speeds with a 14" cutter range from 650-750 RPM.

6303K

A round, 3/8" IC, single sided, coated carbide insert. This is a very economical, general purpose insert for surfacing aluminum. It is advisable to use this insert for rough cutting to remove welding or contaminants before. A PCD insert should be used for the final cut to give the super fine finish required for MLS (multi layer steel) head gaskets. RPM speeds with a 14" cutterhead range from 600-1000 RPM.

RS322

A square 3/8" IC carbide insert with a purple ceramic coating. This carbide insert is normally used for high speed boring. It works well as an economical insert for rough surfacing or heavy stock removal of cast iron. A CBN insert should be used for the final finish cut.

6301J

A square 3/8" IC, 1/16" Radius, double sided, CBN Insert. The 1/16" radius of this insert will produce a more accurate (flatter) finish than a round insert typically used for surfacing on F80/F90 Series machines when surfacing large diesel blocks and heads which are high in nickel. The square surfacing insert is intended for F80/F90 applications where it may encounter heavier cuts and greater interrupted cuts. When using an 18" cutter speeds range from 600-800 RPM, and with a 14" cutter speeds range from 900-1200 RPM.

1/2" (12.70mm) Surfacing Inserts**6303P**

A round 1/2" IC, single sided, PCD Insert. For use on aluminum only - heads and blocks without liners. This insert has a thin layer of PCD applied to the top of a carbide disk. The diamond appears to be a shiny black wafer. The hardness of the diamond resists the abrasive nature of the silica in aluminum heads and blocks. RPM speeds with a 14" cutter range from 1000-2000 RPM. Requires the purchase of 1/2" negative rake tool holders. The standard Rottler 3/8" IC tool holders will not hold this insert.

6303Q

A round 1/2" IC double sided, CBN Insert. An excellent insert for machining cast iron heads and blocks. Round shape gives many cutting edges on each side of insert. Requires the purchase of 1/2" negative rake tool holders. The standard Rottler 3/8" IC tool holders will not hold this insert.

Bi-metal Surfacing**Cylinder Heads with Pre-combustion Chambers and Aluminum Blocks with Hard Sleeves**

Cylinder heads with pre-combustion chambers or aluminum engine blocks with cast iron or steel cylinder sleeves are a challenge to cut and most often require a special cutting insert and special cutting technique. There are many different material combinations so there is not one insert that works the best on all applications. Below is information to use as a guide to the best insert to use and some of the required cutting parameters.

Generally the tool life when using any of these inserts in the cutting of bi-metal surfaces will be short when compared to cutting a single material. The cost of the insert per surfacing job will be higher compared with cutting single materials. The customer must incorporate the higher insert cost into the price charged for the surfacing job.

Another excellent alternative to cutting cylinder heads with pre-combustion chambers is to remove the combustion chamber from the head, surface the cylinder head, then use the Rottler Pre-combustion Chamber Re-seating Tool to machine the combustion chamber counterbore back to OEM specification depth. It is fast and economical to use. See Bulletin C49.

Cylinder Heads with Protruding Valve Seats

Some cylinder heads have valve seats that protrude into the head gasket surface. Valve seats are made out of a wide variety of material. Some are very hard or difficult to cut when compared with the aluminum or cast iron head surface. In many cases it is best to cut the valve seat down below the head surface in a seat and guide machine. This takes a few more minutes when cutting the valve seats but it can save a lot of time and minimize tooling cost when surfacing the head.

The following inserts use Rottler 3/8" (9.52mm) Toolholders supplied with Rottler Surfacing Cutterheads;**6303S**

A round 3/8" IC, single sided, CBN Insert. For use on aluminum blocks with iron liners and aluminum heads with steel pre-combustion chambers. When cutting aluminum heads with pre-combustion chambers it is best to use Rottler's spray mist coolant system or Goodson's HPS-10 High Performance Resurfacing Spray. RPM speeds with a 14" cutter range from 650-750 RPM.

6303U

A round 3/8" IC, single sided, CBN Insert. This insert does an excellent job when cutting hard cast iron blocks and heads of a single material or bi-metal. This insert is the best to use when machining compacted graphite cast iron heads and blocks often found in the performance industry. RPM speeds with a 14" cutter range from 650-750 RPM.

6303R

A round 3/8" IC, single sided, CBN Insert. For use on cast iron heads with steel pre-combustion chambers. RPM speed with a 14" cutter range from 600-700 RPM and with an 18" cutter range from 500-600 RPM.

6301I

A square 3/8" IC, double sided, ceramic insert. For use on cast iron heads with pre-combustion chambers. You can make one finish cut and two rough cuts with each new cutting edge. Always use a new edge when making a finish cut. Use 350-500 RPM on a 14" diameter cutterhead. See Bulletin C49

6301V

A round 3/8" IC, double sided, ceramic insert. For use on cast iron heads with pre-combustion chambers. You can make one finish cut and two rough cuts with each new cutting edge. Always use a new edge when making a finish cut. Use 350-500 RPM on a 14" diameter cutterhead. See Bulletin C49

Special Toolholder and Insert;**7202X**

Holder Assembly, Fly Cutter Tool 3/8" (9.525mm) IC (for use with special insert for aluminum cylinder heads with pre-combustion chamber and cast iron heads with soft precups like Land Rover) for use with 7202Z insert only

7202Z

Round Insert, 3/8" gold coated for aluminum cylinder heads with pre-combustion chamber and cast iron heads with soft pre-combustion chambers like Land Rover). Use in 7202X tool holder only. RPM speeds with 14" cutter range from 450-550 RPM and with a 16" cutter, 400-500 RPM.

Main Line Boring Inserts

Use the same RT series inserts as defined under cylinder boring. Depending on type of toolholder, either 1/4" IC or 3/8" IC inserts will be required. Commonly 1/64" radius inserts are used for rough or heavy cutting, and 1/32" radius inserts are used for finish boring for a smooth surface finish. In extreme conditions where the material is hard or the tool is extended and prone to chatter, use the 1/64" inserts.

Connecting Rod Inserts

The following inserts are commonly used for boring connecting rods.

RTCR321

A triangular, 3/8 IC, 1/64" radius, silver colored insert. This insert is designed to cut 4140 and other steels that connecting rods are often made of. Cutting speed is critical when using this insert. If the insert is operated at a speed that is too slow the surface finish will not be adequate, the tool life will be shortened, and bore geometry will be compromised. The cutting speed should be 800 – 1300 SFM. Feed rate should be between .001" and .004" per revolution depending on the finish requirements.

When connecting rods made of cast iron, the RT series of inserts should be used.

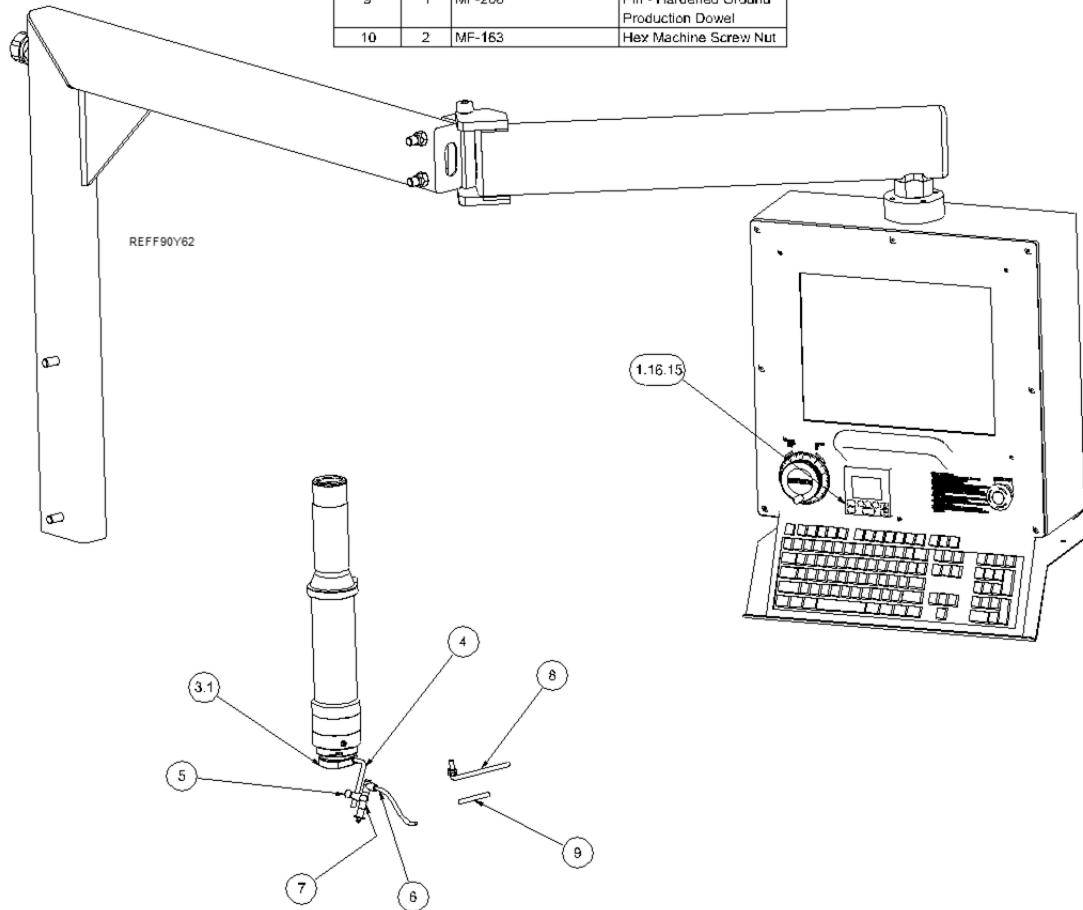

When boring small end bearings made of bronze, the RTF series of inserts should be used.

Measuring and Indicating Devices:

502-12-7B Remote Digital Runout Indicating System:

An optional remote digital indication probe and gauge system is available, to check bore and face runout. The stationary indicator allows easier reading and can be used in the lower bore area where the mechanical indicator cannot be seen. The Digital probe can be used in a considerably smaller bore size relative to the spindle diameter.

REFF90Y65

6757Z Cross Feed Head Assembly

The Cross Feed Head is used to machine faces and tapers (chamfers) that are either too wide or inaccessible to our standard counter boring and chamfering tooling packages.

This Cross Feed system is extremely versatile. However, Rottler's standard boring tools are far superior for quick set up and maximum machining performance on standard boring and counter boring operations.

900-2-19 Micrometer Assembly:

1.5: - 4.1"

2 7/8" Blind Hole Stub Cutterhead:

6519Z With Tooling

6519Y Without Tooling

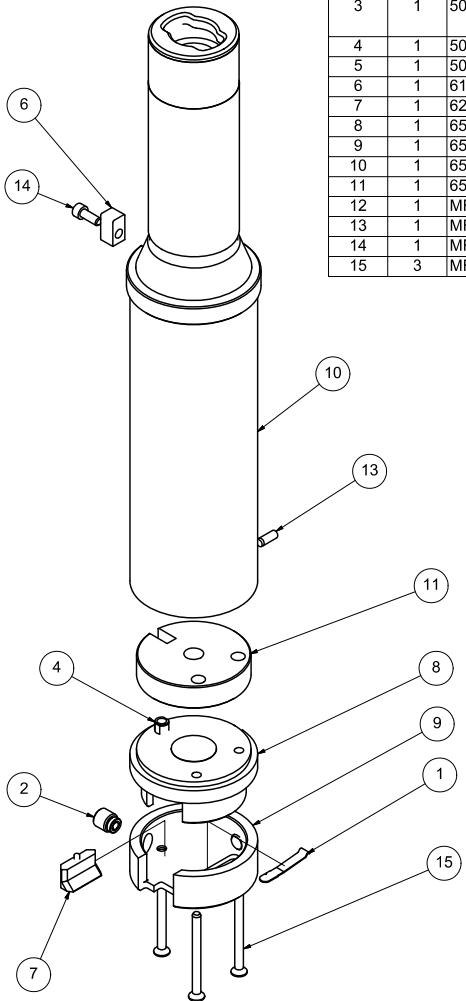

The Production Stub Boring Head has a capacity of 2.90" to 5.00" (74mm to 127mm) to 9.7" (246mm) deep. This cutterhead eliminates the need to remove the tool every time you center the spindle in a new bore.

CAUTION

Be sure that this head does not interfere with lower extremities of the block, such as bosses and hubs.

The cutterhead is designed to clear most all obstructions in U.S. passenger car and truck engines.

14" Diameter Cutterhead

6587 With Tooling

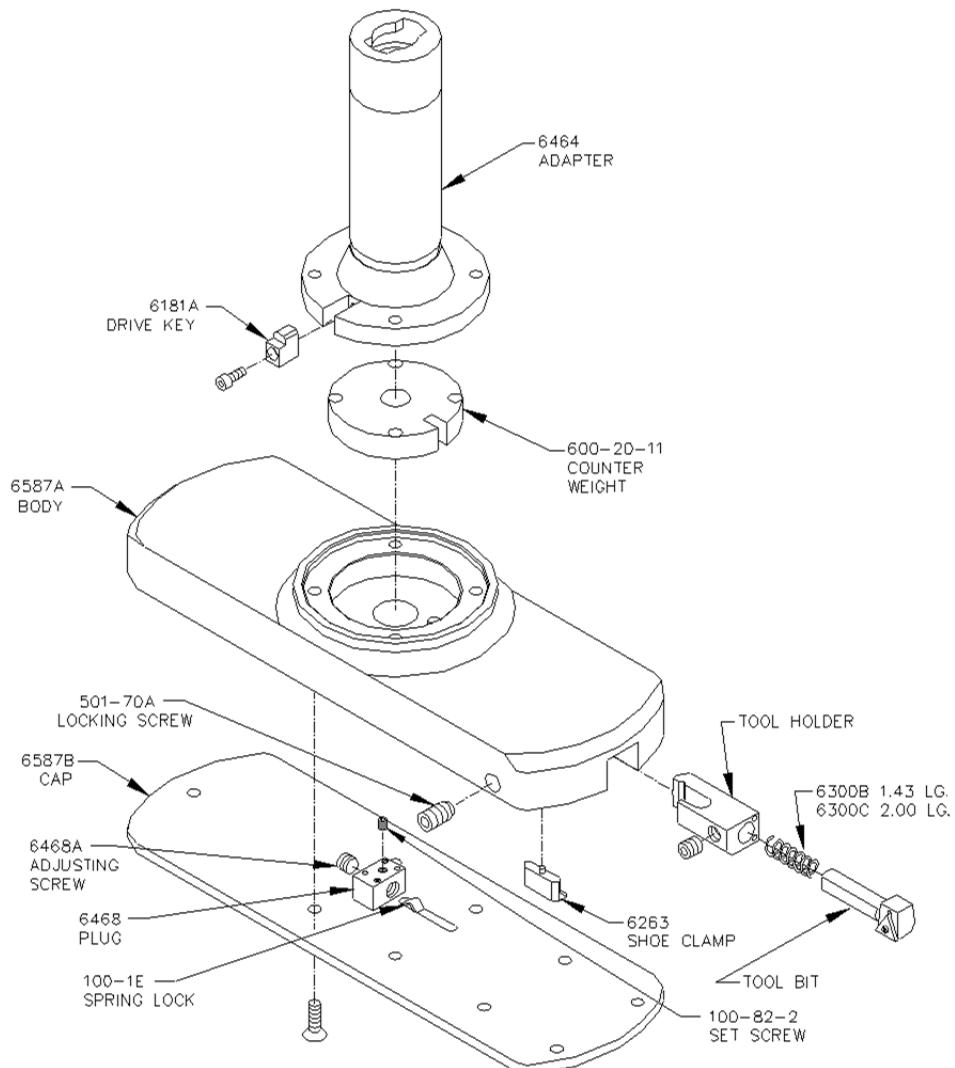

6587D Without Tooling

The 14" cutterhead has a bore capacity of 14.0" to 20.0" diameter.

The large cutterhead is attached in basically the same manner as the smaller cutterheads except that it has no centering fingers.

The optional F90 air gauge or a magnetic based dial indicator must be used to center the cutterhead. The toolholder must be removed to center each bore.

14" Surfacing Cutterhead

6294U With Tooling

The 14" Surfacing Cutterhead is used to machine off the mating surfaces of most cylinder blocks and cylinder heads.

The surfacing cutterheads install the same way as the boring cutterheads do.

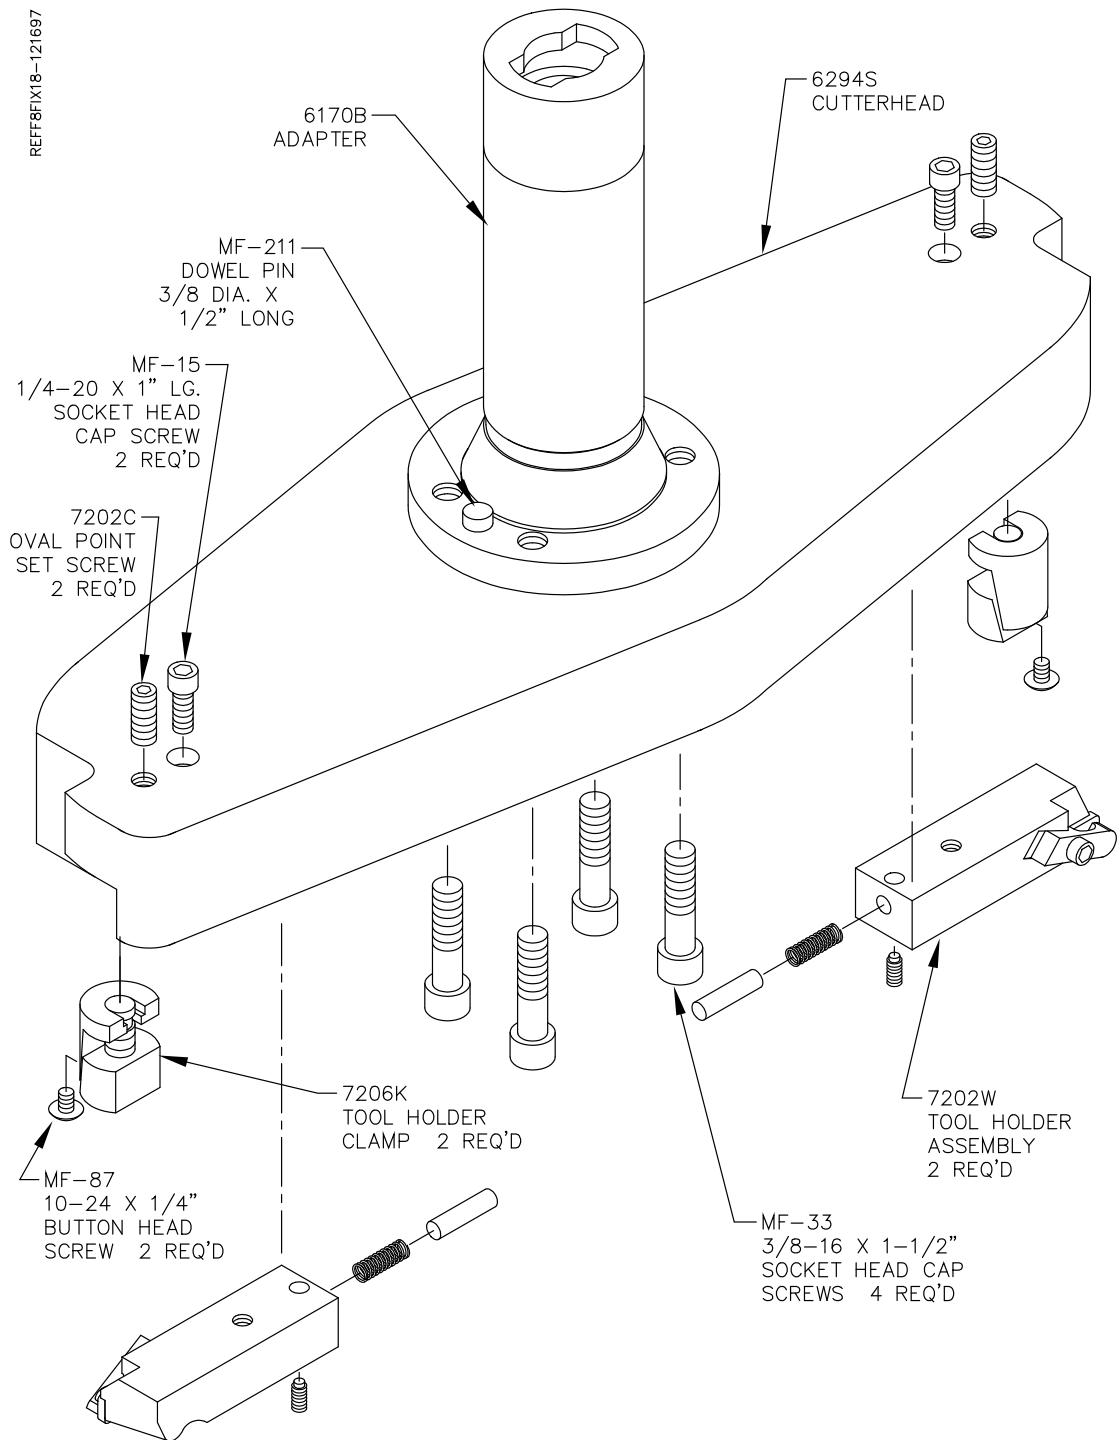

18" Surfacing Cutterhead

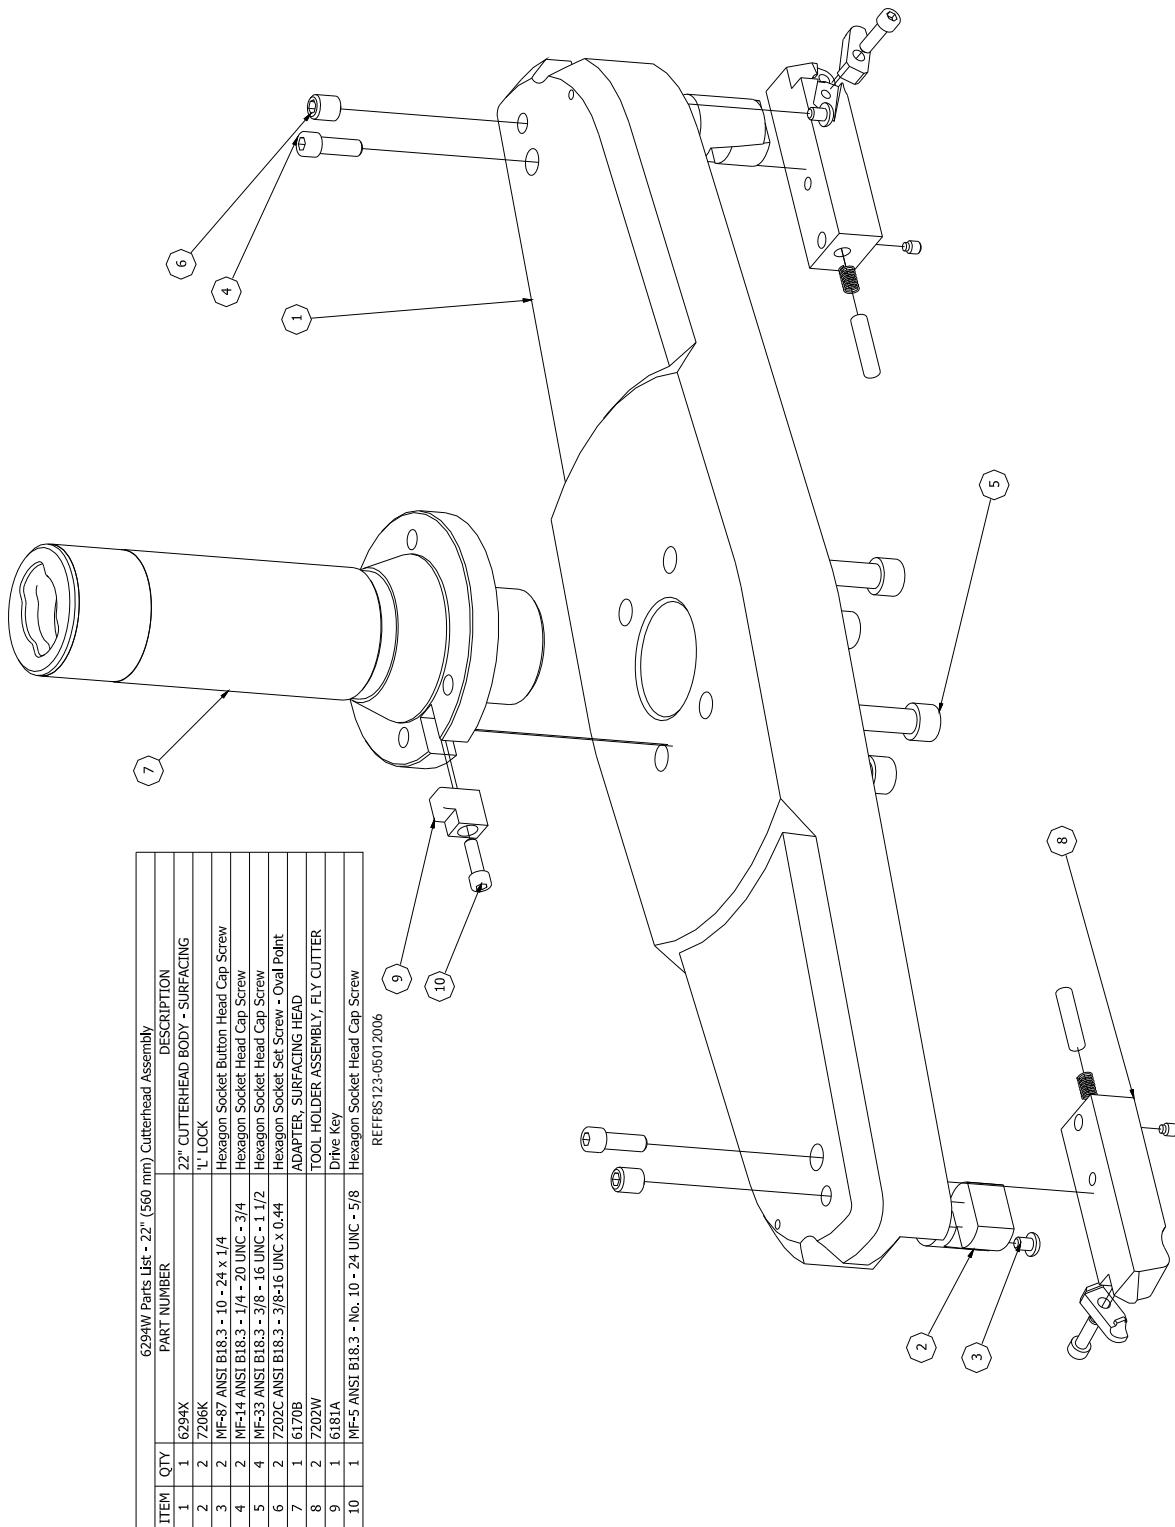

6294T With Tooling

The 18" Surfacing Cutterhead is used to machine the mating surfaces off most cylinder blocks and cylinder heads.

The surfacing cutterheads install the same way as the boring cutterheads do.

6294W 22" (560 mm) Surfacing Cutterehead

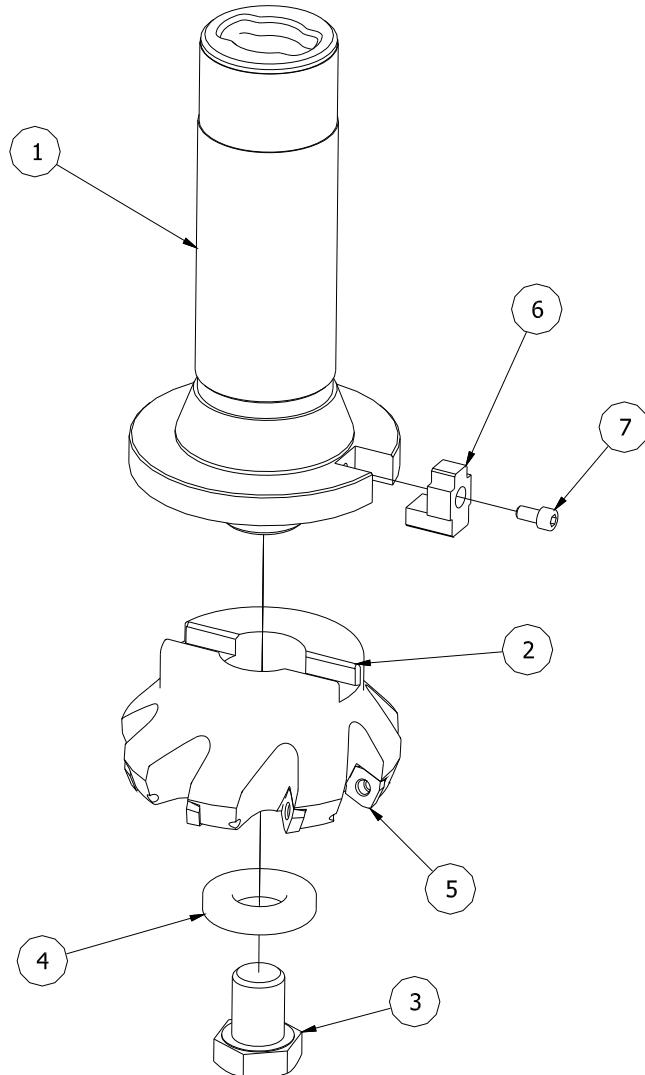

Optional Surfacing Tooling:

Tool Holder	Description
7202W	Square or Round, 3/8", Negative Rake
7202V	Square or Round, 1/2", Negative Rake
7202U	Square or Round, 1/2", Posative Rake

5" Diameter Shell Mill:

6514L With Tooling

The 5" Diameter Shell Mill was designed for cutting blocks and heads that have been repaired by welding. Using the shell mill instead of the surfacing cutterheads reduces chatter. There are many other jobs that this versatile cutterhead could be used for. Use this cutterhead for any cut that is too narrow for the regular surfacing cutterheads.

501-72 Hex Drivers

REF 501-72-000000

Standard Inserts	
RT322	3/8 IC TRIANGLE 1/32 RADIUS
RT321	3/8 IC TRIANGLE 1/64 RADIUS

Minimum Distance Between Bearing Housings:

Cutterheads			
650-2-39B 1.9" (48.26mm) Dia.	650-2-39C 2.9" (73.66mm) Dia.	650-2-39A 5.4" (137.16mm) Dia.	
Right Angle Drive			

F65:

6753K	3.29" (83.57mm)	4.07" (103.38mm)	4.09" (103.63mm)
6753K w/ .70" (17.78mm) Spacer	3.99" (101.35mm)	4.77" (121.16mm)	4.78" (121.41mm)
6753K w/ 1.05" (26.67mm) Spacer	4.34" (110.24mm)	5.12" (130.05mm)	5.13" (130.30mm)
6753K w/ 1.50" (38.10mm) Spacer	4.79" (121.67mm)	5.57" (141.48mm)	5.58" (141.73mm)

Calculating Maximum Bore Depth:

Bores 1.9" – 2.14" (48.26mm – 54.36mm) Dia. = Subtract 2.085 (52.959mm) from total Width.
 Bores 2.14" – 3.12" (54.36mm – 79.25mm) Dia. = Subtract 1.655 (42.037mm) from total Width.
 Bores 3.12" (79.25mm) Dia. and Larger = Subtract 1.457 (37.008mm) from total Width.

F90:

6753J	3.40" (86.36mm)	4.18" (106.17mm)	4.19 (106.43mm)
6753J w/ .70" (17.78mm) Spacer	4.10" (104.14mm)	4.88" (123.95mm)	4.99" (126.75mm)
6753J w/ 1.05" (26.67mm) Spacer	4.45" (113.03mm)	5.23" (132.84mm)	5.24" (133.10mm)
6753J w/ 1.50" (38.10mm) Spacer	4.90" (124.46mm)	5.68" (144.27mm)	5.69" (144.53mm)

Calculating Maximum Bore Depth:

Bores 1.9" – 2.34" (48.26mm – 59.69mm) Dia. = Subtract 2.572 (65.329mm) from total Width.
 Bores 2.35" – 3.69" (59.69mm – 93.73mm) Dia. = Subtract 2.165 (54.991mm) from total Width.
 Bores 3.69" (93.73mm) Dia. and Larger = Subtract 1.457 (37.008mm) from total Width.

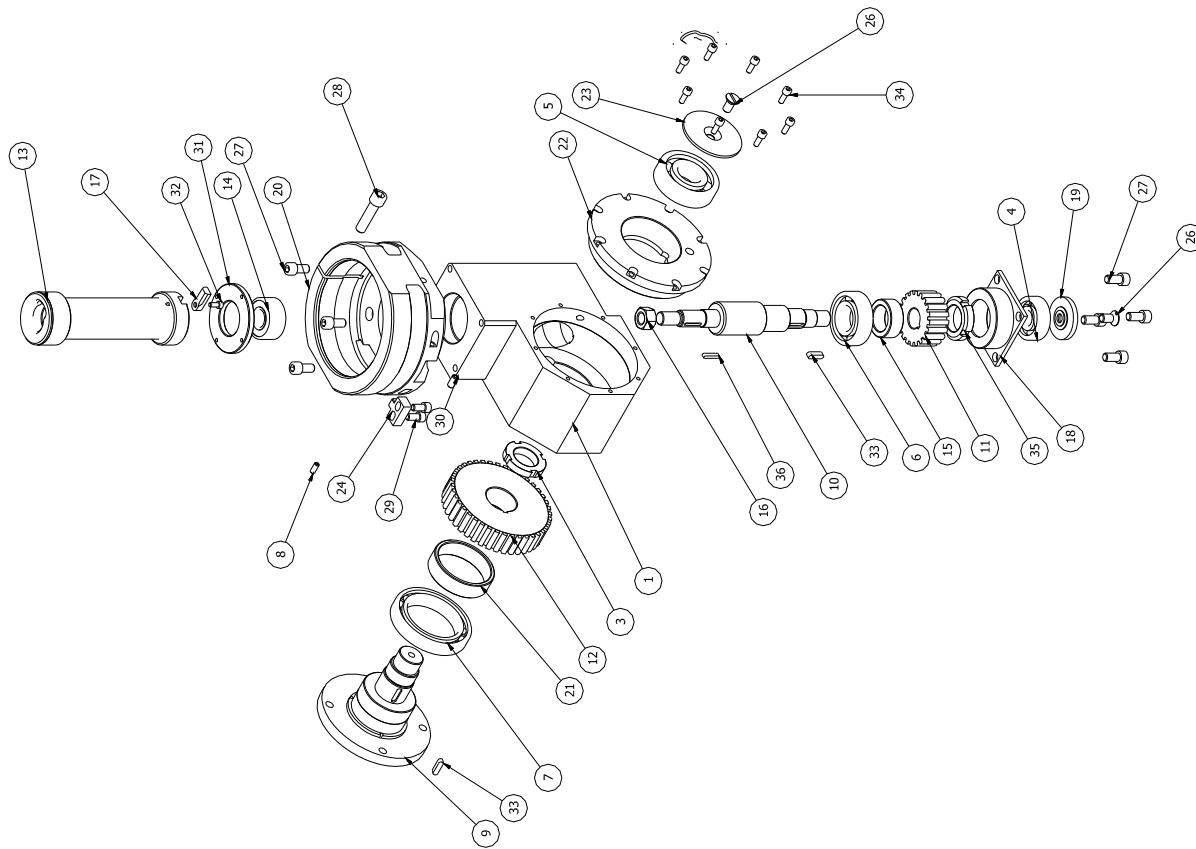

Belt Drive:

6753L & 650-2-37	2.69" (68.33mm)	NOT RECOMMENDED	NOT RECOMMENDED
6753L & 650-2-37 w/ .70" (17.78mm) Spacer	3.40" (86.36mm)	NOT RECOMMENDED	NOT RECOMMENDED
6753L & 650-2-37 w/ 1.05" (26.67mm) Spacer	3.74" (95.00mm)	NOT RECOMMENDED	NOT RECOMMENDED
6753L & 650-2-37 w/ 1.50" (38.10mm) Spacer	4.19" (106.43mm)	NOT RECOMMENDED	NOT RECOMMENDED

Calculating Maximum Bore Depth:

For Bores less than 2.40" (60.96mm) Dia. = Subtract 1.381" (35.077mm) from total Width.
 For bores 2.40" (60.96mm) Dia. and Larger = Subtract .975" (24.765mm) from total Width.

2.0" – 4.0" (50mm – 100mm)

501-72 Hex Drivers

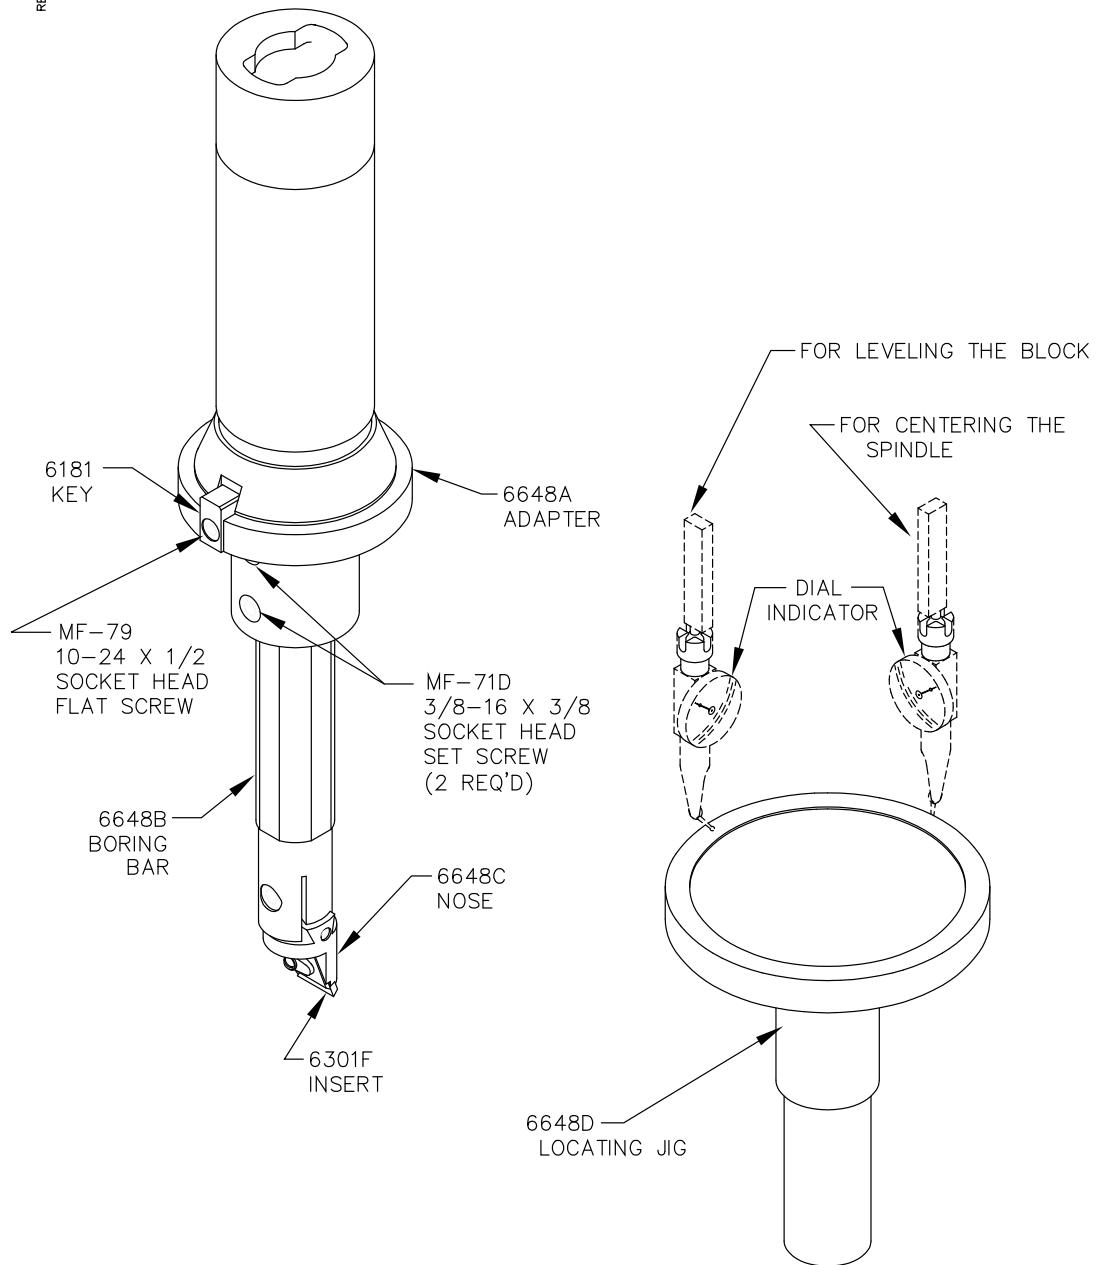

REF 19012-0425000

Standard Inserts	
RT322	3/8 IC TRIANGLE 1/32 RADIUS
RT321	3/8 IC TRIANGLE 1/64 RADIUS
RT212	1/4 IC TRIANGLE 1/32 RADIUS
RT211	1/4 IC TRIANGLE 1/64 RADIUS

6648 Caterpillar 3400 Series Tappet Bore Repair Kit:

REFBULL-91-121797

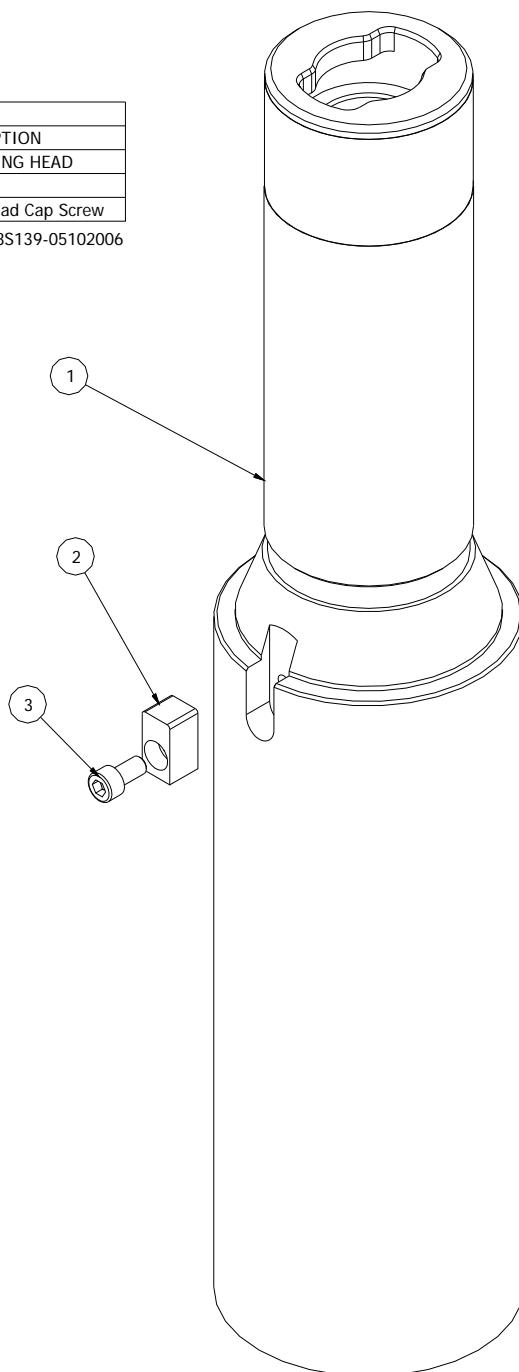

Spindle Adapters for Mounting Universal Tooling

6170C Blank Adapter

This adapter can be machined by the customer to suit special tooling needs.

6170C Parts List			
ITEM	QTY	PART NUMBER	DESCRIPTION
1	1	6170L	ADAPTER, SURFACING HEAD
2	1	6181	Drive Key
3	1	ANSI B18.3 - 10-32 UNF - 0.375	Hexagon Socket Head Cap Screw

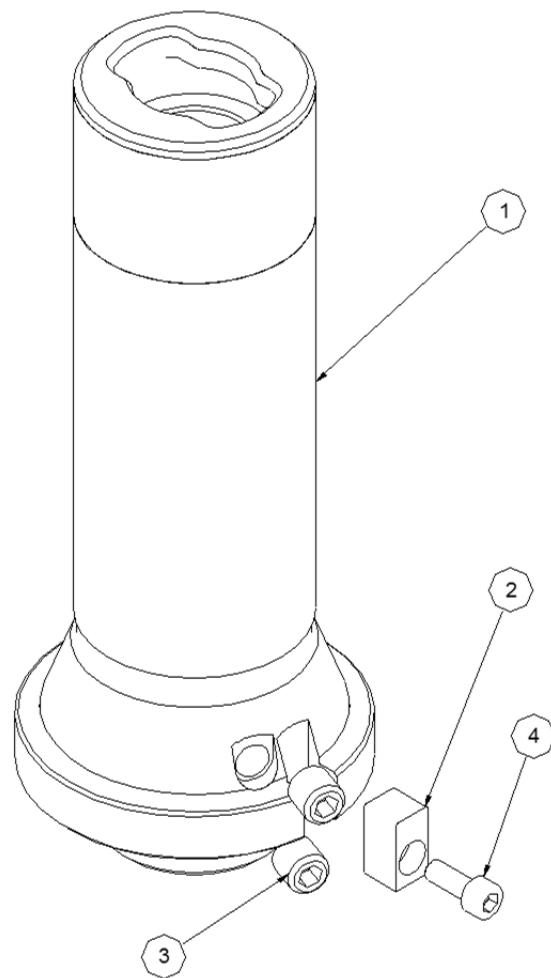

REFF8S139-05102006

6648M 1" (25.4 mm) Spindle adapter for driving 1" shank tooling:

Parts List			
ITEM	QTY	PART NUMBER	DESCRIPTION
1	1	6648A	
2	1	6181	Drive Key
3	2	ANSI B18.3 - 3/8-16 UNC x 0.38	Hexagon Socket Set Screw - Flat Point
4	1	MF-21	Hexagon Socket Head Cap Screw

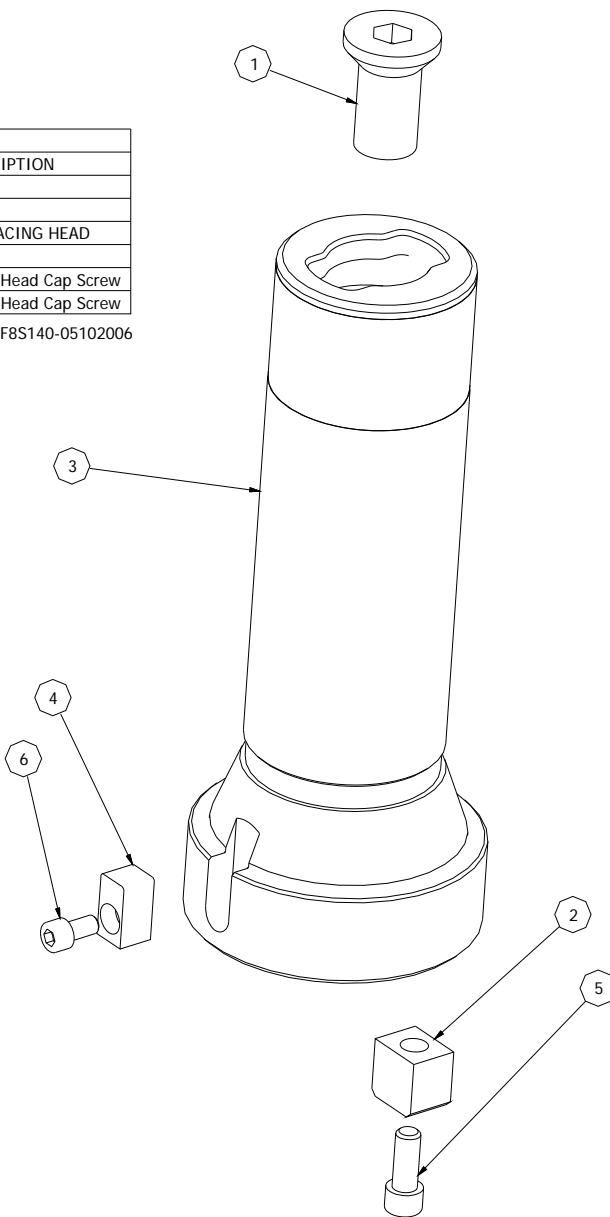

REFF90Y64

6170J #40 Taper Adapter Assembly

Parts List			
ITEM	QTY	PART NUMBER	DESCRIPTION
1	1	6170F	Locking Screw
2	1	6170H	Key, Drive
3	1	6170E	ADAPTER, SURFACING HEAD
4	1	6181	Drive Key
5	1	ANSI B18.3 - 1/4 - 20 UNC - 5/8	Hexagon Socket Head Cap Screw
6	1	ANSI B18.3 - No. 10 - 24 UNC - 3/8	Hexagon Socket Head Cap Screw

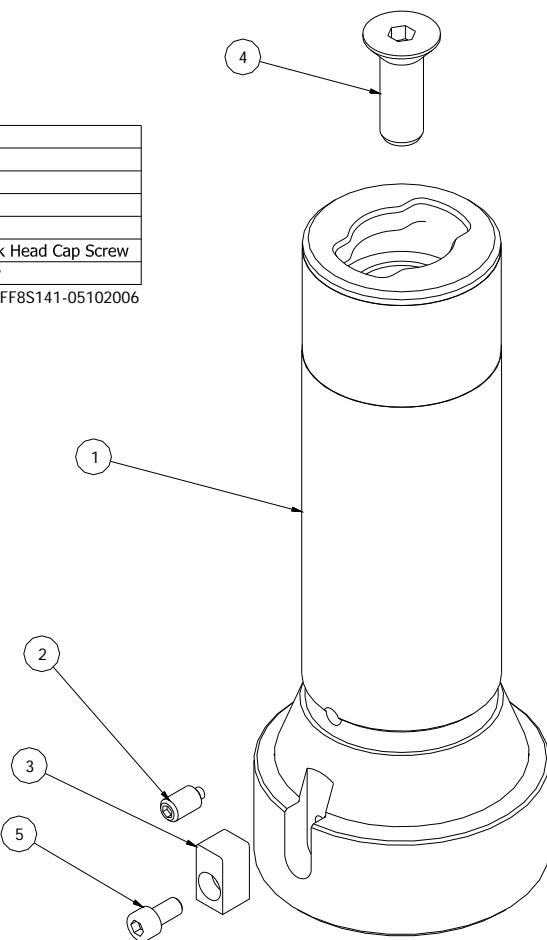

REFF8S140-05102006

6170K R8 Adapter Assembly

6170K Parts List			
ITEM	QTY	PART NUMBER	DESCRIPTION
1	1	6170D	ADAPTER, FOR R8 TOOLING
2	1	514-3-12K	Screw, key Lower Limit
3	1	6181	Drive Key
4	1	ANSI B18.3 - 7/16-20 UNF x 1.25	Hexagon Socket Flat Countersunk Head Cap Screw
5	1	ANSI B18.3 - 10-32 UNF - 0.375	Hexagon Socket Head Cap Screw

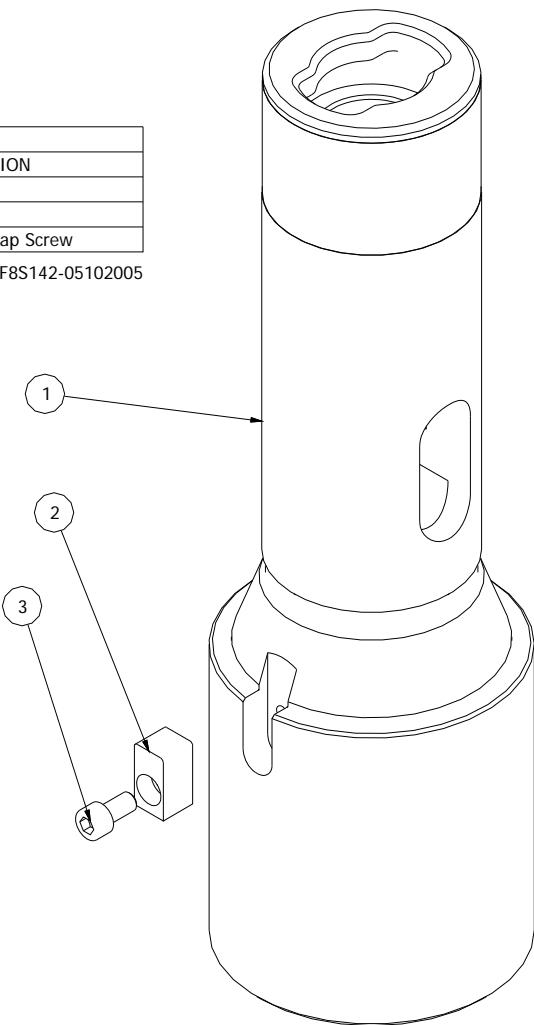

REFF8S141-05102006

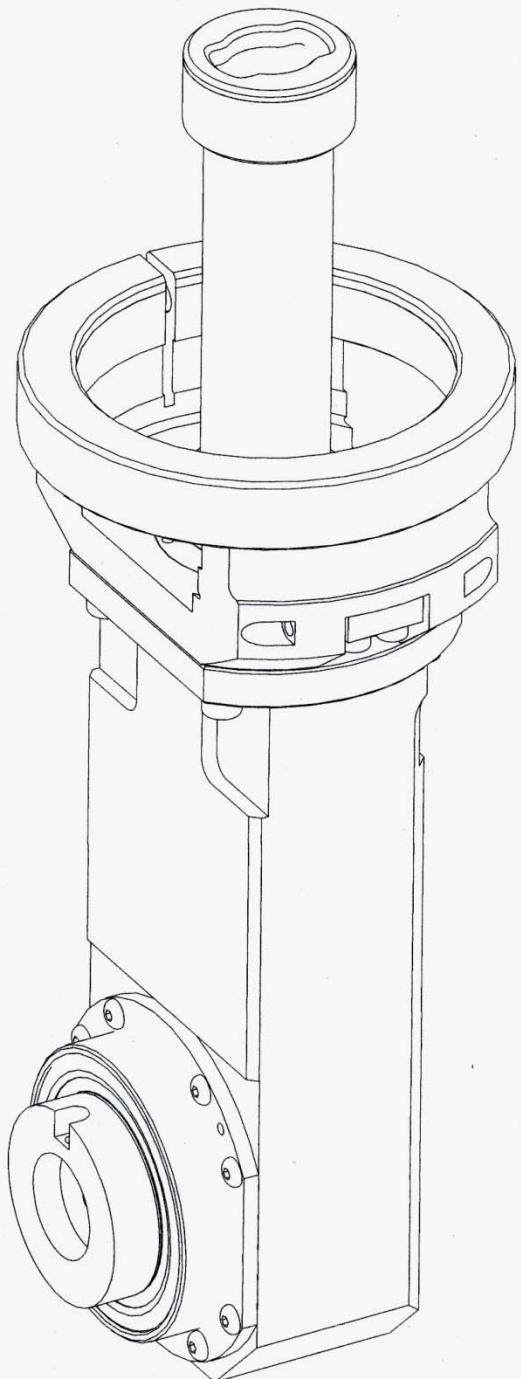

6514Q Adapter, MT #5

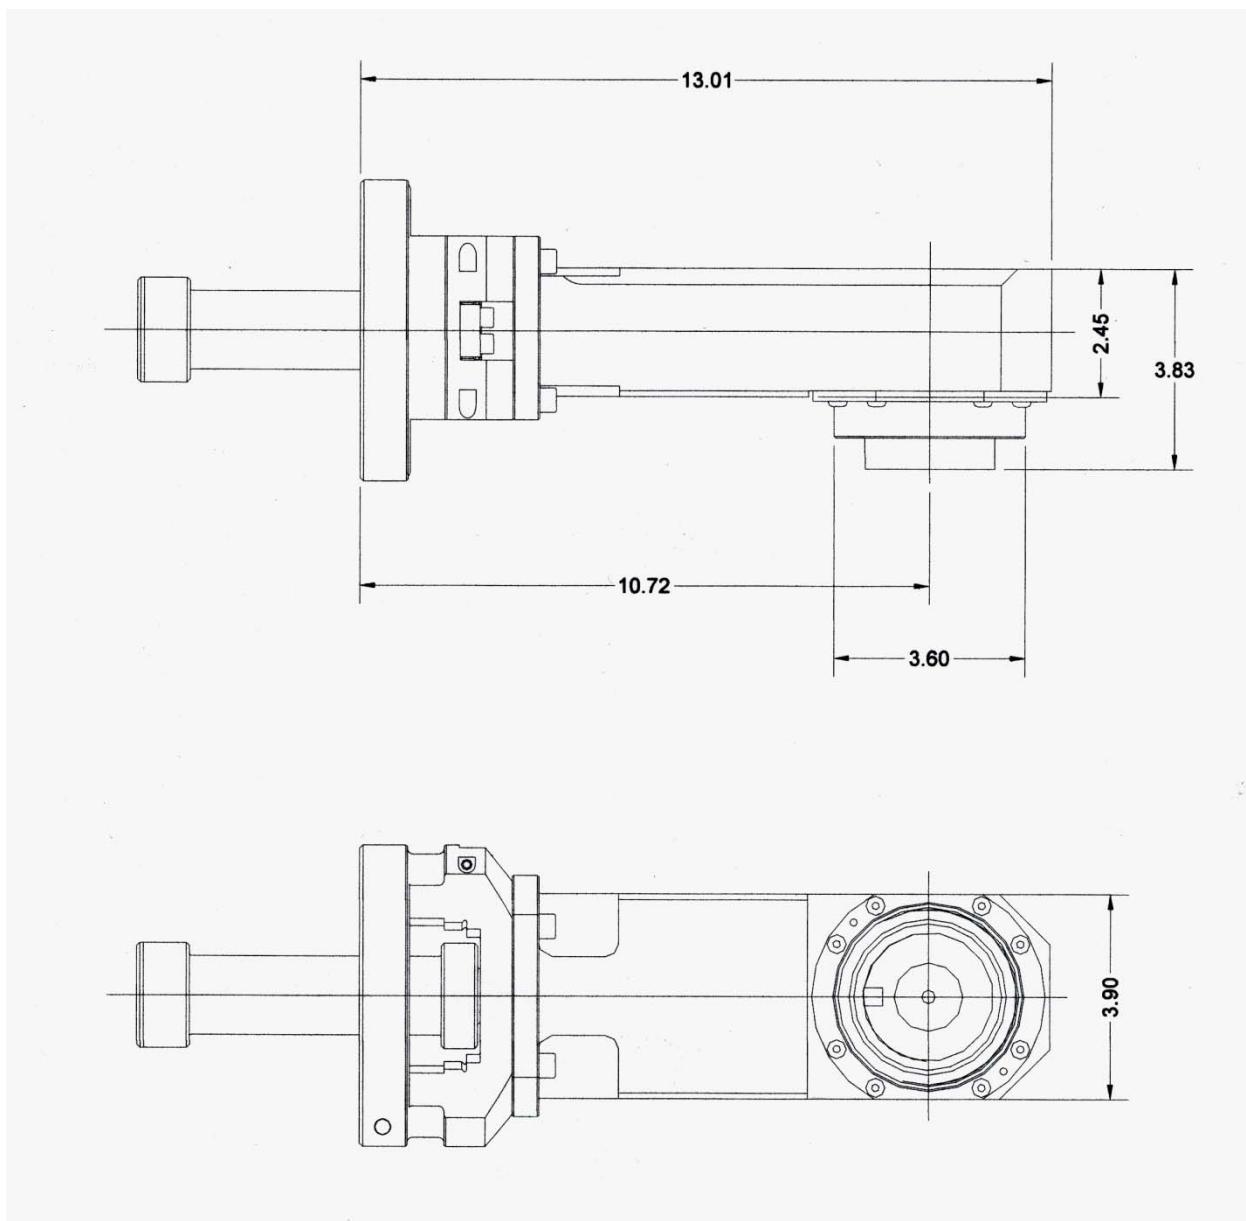

6514Q Parts List			
ITEM	QTY	PART NUMBER	DESCRIPTION
1	1	6514Q	Adapter, MT #5
2	1	6181	Drive Key
3	1	ANSI B18.3 - 10-32 UNF - 0.375	Hexagon Socket Head Cap Screw

REF8S142-05102005
